Central Radio Propagation Laboratory

The propagation of radio waves over long distances depends on their reflection from the ionosphere, the electriconducting layers in the earth's upper atmosphere. The characteristics of these layers are continually changerous for regular and reliable communication, it is therefore necessary to collect and analyze ionospheric data from all over the world in order that predictions of usable frequencies between any two places at any hour can be During the war, the United States Joint Communications Board set up the Interservice Radio Propagation atory at the National Bureau of Standards to centralize ionospheric work and predictions for the Armed Forces United States.

On May 1, 1946, this activity returned to peacetime status as the Central Radio Propagation Laboratory of the Inal Bureau of Standards. Designed to act as a permanent centralizing agency for propagation predictions and so, analogous in the field of radio to the reports of the Weather Bureau in the field of meteorology, the Central Propagation Laboratory was established in cooperation with the many Government agencies vitally concerned communication and radio propagation problems. These agencies are represented on an Executive Council which is the work of the Laboratory; included are the Department of the Army, Department of the Navy, Department of Air Force, Civil Aeronautics Administration, Federal Communications Commission, Department of State, Guard, Coast and Geodetic Survey, and the Weather Bureau. In addition, industry is represented by a member of Washington Serves in an advisory capacity and the Research and Development Board has designated an ver.

the Central Radio Propagation Laboratory receives and analyzes data from approximately 60 stations located ghout the world, including 13 domestic and 8 overseas stations which are operated either directly or under act by the National Bureau of Standards. Ionospheric data and predictions are disseminated to the Armed s, commercial users, scientists, and laboratories. The basic ionospheric research of the Laboratory includes etical and experimental studies of maximum usable frequencies, ionospheric absorption, long-time variations of propagation characteristics, the effects of the sun on radio propagation, and the relation between radio distance and geomagnetic variation. In the microwave field, the Laboratory is investigating the relation between propagation and weather phenomena, as well as methods by which predictions can be made and radio communities improved in this portion of the radio-frequency spectrum. Another phase of the Laboratory's work is the appment and maintenance of standards and methods of measurement of many basic electrical quantities throughnee entire frequency spectrum.

ac Radio Propagation Predictions

The CRPL Series D, Basic Radio Propagation Predictions, is issued monthly as an aid in the determination of test sky-wave frequencies over any path at any time of day for average conditions for the month of prediction, on this in advance. Charts of extraordinary-wave critical frequency for the F2 layer, of maximum usable frematy for a transmission distance of 4,000 km, and of percentage of time occurrence for transmission by sporadic percentage of 15 Mc, for a distance of 2,000 km, are included.

LETTER OF PROMULGATION

NC 13 (T), BASIC RADIO PROPAGATION PREDICTIONS FOR SEPTEMBER 1952, is a nonregisunclassified publication, issued to U.S. Naval Service predicting the useful frequencies for the month of amber 1952.

This publication is EFFECTIVE for use during the month of September 1952. It is distributed within the U.S. Navy through the facilities of the Registered Publication System in accordance with the allowances contained in the effective edition of the Registered Publication Allowance Tables.

3. This publication may be retained for reference purposes or destroyed after the period covered by the predictions is ended. No report of destruction is required.

BASIC RADIO PROPAGATION PREDICTIONS

For SEPTEMBER 1952

Three Months in Advance

Introduction

The CRPL-D series, "Basic Radio Propagation Predictions," issued by the National Bureau of Standards, contains contour charts of F2-zero-MUF and F2-4000-MUF for each of the three zones, W, I, and E, into which the world is divided for the purpose of taking into consideration the variation of the characteristics of the F2 layer with longitude (figs. 1 to 6); the world-wide contour chart of E-2000-MUF (fig. 7); the contour chart of median fEs (fig. 8); and the chart showing percentage of time occurrence for Es-2000-MUF in excess of 15 Mc (fig. 9).

Methods for using these charts are given in Circular 465 of the National Bureau of Standards, entitled "Instructions for the Use of Basic Radio Propagation Predictions," and available from the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C., price 30 cents (foreign 40 cents). Requests for this manual and for the basic predictions from members of the Army, Navy, or Air Force should be sent to the proper service address as follows. For the Army: Office of the Chief Signal Officer, Department of the Army, Washington 25, D. C., Attention: SIGOL-2. For the Navy: Chief of Naval Operations, Department of the Navy, National Defense Building, Washington 25, D. C. (CNO OP-203Q). For the Air Force: Director of Communications, Department of the Air Force, Washington 25, D. C., Attention: AFOAP.

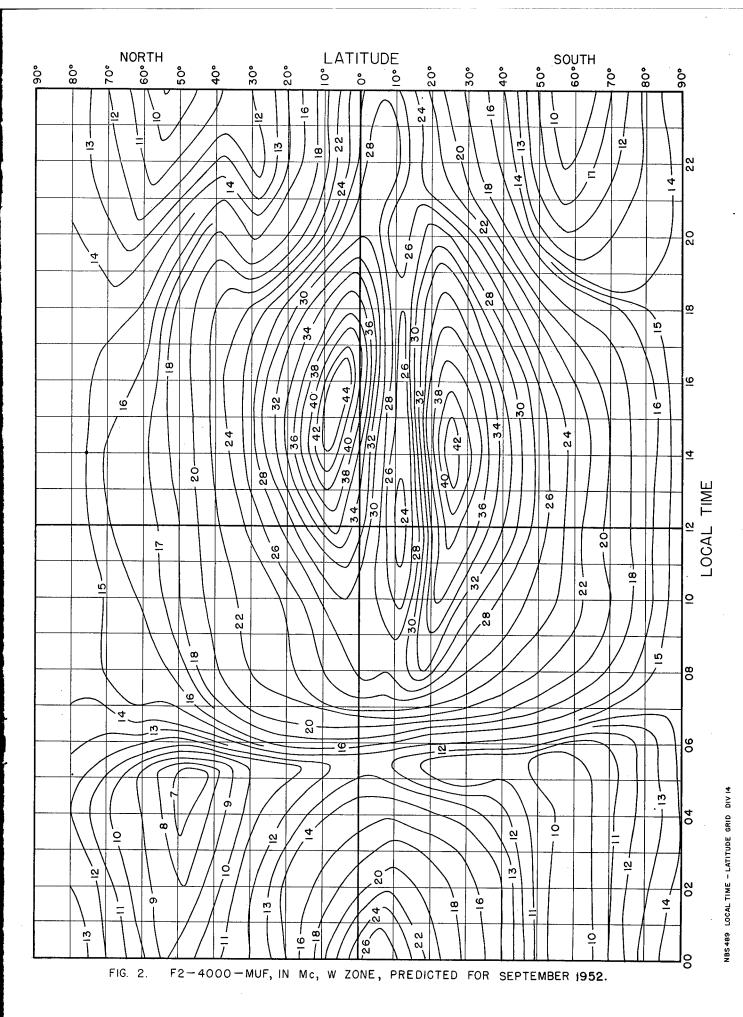

Following figure 9 of each issue, sets of auxiliary figures (nos. 1, 2, 11, 12, NBS Circular 465) or forms CRPL-AF and AH are given in rotation, two in each issue of CRPL Series D. They are necessary or useful for the preparation of tables and graphs of MUF and FOT (OWF), as explained in NBS Circular 465.

The charts in this issue were constructed from data through March 1952, together with a predicted smoothed 12-month running-average Zürich sunspot number of 46, centered on September 1952.

Attention is invited to the blank form at the end of this publication, for use in reporting the accuracy of the predictions of MUF and FOT (OWF) as given in this report. Communications should be addressed to Central Radio Propagation Laboratory, National Bureau of Standards, Washington 25, D. C.

Information concerning the theory of radio-wave propagation, measurement technics, structure of the ionosphere, ionospheric variations, prediction methods, absorption, field intensity, radio noise, lowest required radiated power and lowest useful high frequency is given in Circular 462 of the National Bureau of Standards, "Ionospheric Radio Propagation.". This circular is available from the Superintendent of Documents, price \$1.00 (foreign, \$1.25).
